Project Proposal

AI-Based Smart Student Management System over Network

Course: Database & Computer Network

Team Members:

Shereen Ayman - 24030302

Menna Wasem - 24030342

1. Project Idea

This project aims to develop a Smart Student Management System that manages student data such as personal information, courses, grades, and attendance. The system also integrates Artificial Intelligence (AI) to predict student performance. Additionally, the system supports multi-user access over a network through a shared database.

2. Objectives

- Design and implement a relational database for student data.
- Apply AI techniques to predict student performance.
- Support multi-user access over a network.
- Build a simple and easy-to-use system.

3. System Components

A. Database: Students, Courses, Enrollments, Grades, Attendance.

B. Artificial Intelligence: Predict student performance using simple models.

C. Networking: Shared database with multi-user access over a local network.
